the handbook of cholesterol biology function and role in health and disease gathers a substantial set of contributions supporting the modern view that dietary and blood cholesterol are safe or even beneficial in a balanced omega 6 3 fatty acids environment whereas they may turn into unsafe or detrimental to health in a typical omega 6 fatty acid environment dietary and blood cholesterol including ldl cholesterol are secondary risk factors which belong to the human omnivorous diet and physiology which may represent clinical valid surrogates of the outcome cardiovascular diseases however the primary risk factors the omega 6 3 fatty acids determine whether human health is in the safe evolutionary zone or not omega 6 3 fatty acids are essential to human physiology they must be present and maintained in physiologically defined essential amounts and balanced in blood and tissue lipid pools through the diet chronic deviations from omega 6 3 fatty acids make ldl cholesterol valid indicators of cardiovascular disease the handbook takes preventive and acute approaches based on biochemical and clinical evidence to the management of cholesterol a per se non essential nutrient yet an essential blood and tissue component the reviews especially when combined will help understand the essentiality of dietary and blood cholesterol as risk factors in human health

this volume presents results from three large more contemporary prospective mortality studies and provides longer followup for two of the older studies dating from the 1950 s when observations from the more contemporary studies are compared with those from the 1950 s one important but disturbing conclusion is apparent mortality risks among continuing smokers both

males and females have increased in fact relative risks for smokers compared to never smokers have increased for all major smoking related diseases coronary heart disease chd lung cancer other smoking related cancers stroke and chronic obstructive pulmonary disease copd this increase over time in the relative risks for smokers compared to never smokers has occurred despite a dramatic decline in cardiovascular disease cvd death rates in the u s population suggesting that the decline in cvd death rates has been proportionately greater among never smokers than among continuing smokers the clearest message that is drawn from the enormous quantity of data presented in this monograph is that smoking prevention and cessation efforts are complementary not alternative solutions to the current epidemic of diseases caused by smoking

this volume contains five background papers describing in greater detail some of the research techniques discussed in the report identifying health technologies that work searching for evidence

contains 5 background papers describing health research techniques using patients reports large administrative database analysis large simple randomized trials meta analysis clinical economic trials describes new methods new adaptations of health technologies that work best measures outcomes in competing medical technologies which competing medical technologies are more effective references tables

this volume examines the wide ranging careers and diverse lives of american women physicians shedding light on their struggles for equality professional accomplishment and personal happiness over the past 150 years book jacket

coronary heart disease remains the leading cause of death in both men and women in most industrialized countries yet it is largely preventable and health care providers can acquire the skills to help their patients reduce their risks substantially traditional risk factors such as cigarette smoking hypercholesterolemia hypertension sedentary lifestyle obesity and glucose intolerance explain a major proportion of coronary events recent evidence also suggests important adjunctive roles for hormone replacement therapy in postmenopausal women and aspirin prophylaxis in individuals at high risk of a first myocardial infarction emerging evidence indicates an important role for diet in the prevention of heart disease although the importance of lifestyle and behavioral modifications may well be known among physicians and other health care providers the implementation of this knowledge has been limited one reason is that the information supporting the value feasibility and cost effectiveness of risk reduction strategies has not been previously synthesized and made widely available to health care providers in office and community settings prevention of myocardial infarction fills these critical gaps by providing a state of the art compendium of the scientific evidence on the efficacy of coronary disease prevention while focusing on helping clinicians develop intervention skills to utilize available knowledge chapters by leading authorities in cardiovascular epidemiology clinical cardiology cost effectiveness analysis and public health translate the theory of preventive cardiology into feasible implementation the counseling and other intervention strategies described in this textbook have

documented clinical efficacy and cost effectiveness and they require little time to learn or implement the book is written mainly for primary care providers including general internists and family physicians but will also be of interest to medical subspecialties such as cardiologists and endocrinologists as well as medical students dietitians psychologists epidemiologists and students practitioners and researchers in public health

this book examines the current state of evidence relating to the effectiveness of primary prevention measures the identification of environmental and lifestyle factors as causes of cancer means that the theoretical basis for the prevention of cancer is well established despite this there have been relatively few studies which examine the effectiveness of different strategies in reducing cancer causing exposures and even fewer where the results in terms of cancers avoided can be assessed most such evidence derives from observational studies which show that changes in cancer incidence occur when diet or tobacco use are modified even in modification is not the result of an organized preventive action the occupational field too provides good examples of reduction in exposure to carcinogens if not always because of their carcinogenic hazard and consequent reductions in cancer incidence this volume provides an in depth study of four intervention studies examining their outcome in terms of cancer risk it also reviews the results of several other previously published studies and provides a convenient summary of results as well as information on future prospects
